

Digital Signal Analysis

END EXAM - 2024

Answer all questions.

MAX TIME: 2:30 min

Max Marks: 40

1. Design the below filter using FIR [8M]
a) without window
b) with window $w(n) = 0.5 \left[1 - \cos\left(\frac{2\pi n}{N}\right) \right]$
Assume N as 7.
- 
2. a) Derive and explain how speech production is modeled with all pole system. [4M]
b) How to obtain spectrogram and what is the need for it? [4M]
Is spectrogram unique? Justify.
3. Draw direct form-I and II implementation of digital system [4M]
$$y(n) = x(n) - 0.5x(n-1) + 0.4y(n-1) + 0.6y(n-2)$$
4. Find the impulse response of $h(n)$ of a causal discrete system characterized by following difference equation [4M]
$$y(n) - \frac{3}{4}y(n-1) + \frac{1}{8}y(n-2) = 2x(n)$$
5. a) What is the need of DSP processor and how they are different with general purpose processor. [3M]
b) What is the need of linear phase FIR filter and how to achieve it? [3M]
6. Find Inverse DFT (IDFT) using any FFT algorithm. [4M]
 $\{ 2\delta, -4 + 4j, -4, -4 - 4j \}$
7. a) If we have 8 KHz sampled signal and we took 20ms window and applied FFT. If we take 256 point FFT $X[4]$ value show which frequency? If we take 512 point $X[4]$ show which frequency? [4M]
b) When digital system called minimum phase? Give example [2M]
